

Change Request EXP-01 Customer Key Expansion (Experiment)

Field	Value
Ticket	EXP-01
Priority	High
System	Customer Master (CUSMAS)
Requested by	Enterprise Architecture

Background

The customer key CUSID is a CHAR(9) value in the format AAA999999 (3 alpha characters + 6 digits). The id space is nearly exhausted.

Requirement

Expand the customer key from CHAR(9) to CHAR(12), new format AAA999999999 (3 alpha + 9 digits). Every program, file definition, copybook, query, and batch job that reads, writes, validates, or slices the customer key must be identified and updated.

Acceptance criteria

1. All file definitions and copybooks define the key as CHAR(12).
2. All validation logic accepts the 12-character format.
3. No program or batch job truncates a 12-character key.
4. All positional/substring access to the key is corrected, including downstream fields whose offsets shift.
